Fericon

# Underground lift system

Fericont for underground storage of roll cages  
with a volume of 240, 360, 660, 770 or 1100 litres

MORE! B.V. is a specialist in devising, developing and constructing new collection concepts and systems. The Fericon is designed for underground storage in which use is made of roll cages. In this way various sizes of roll cage can be used with volumes ranging from 240 litres to 1.100 litres

It is also possible to collect several types of waste simultaneously underground using the Fericon. To achieve this, two roll cages are used with a volume, for example, of 360 litres.

The lift system is positioned in a non-porous concrete pit. The main advantage of this lift system is that it can be built into any existing concrete pits that have already been installed!

## Special characteristics of the underground lift system

- Positioning in an (existing) watertight concrete pit
- Available with various columns for depositing waste
- Available with various openings (lid/drum/channel)
- Anti-slip standing platform
- Reliable lift system with a maximum capacity of over 1.000 kg.
- No power supply necessary
- Easy to maintain and clean
- Can be extended to include a system for access control
- Flexibility through the large variety of roll cages that can be used
